### Target applications

Target applications for the TLI496x Hall Latch family are all applications which require a high precision Hall Latch with an operating temperature range from -40°C to 125°C. Its superior supply voltage range from 3.0 V to 32 V with overvoltage capability up to 42 V without external resistor makes it ideally suited for industrial applications.

The magnetic behavior as a latch and switching thresholds of typical  $\pm 2$  mT make the device especially suited for the use with a pole wheel for index counting applications and for rotor position detection as in brushless DC motor commutation.

**1 Functional description**

**1.5 Functional block description**

The chopped Hall IC switch comprises a Hall probe, bias generator, compensation circuits, oscillator and output transistor.

The bias generator provides currents for the Hall probe and the active circuits. Compensation circuits stabilize the temperature behavior and reduce influence of technology variations.

The active error compensation (chopping technique) rejects offsets in the signal path and the influence of mechanical stress to the Hall probe caused by molding and soldering processes and other thermal stress in the package. The chopped measurement principle together with the threshold generator and the comparator ensures highly accurate and temperature stable magnetic thresholds.

The output transistor has an integrated overcurrent and overtemperature protection.

**1 Functional description**

**1.6 Default start-up behavior**

The magnetic thresholds exhibit a hysteresis  $B_{HYS} = B_{OP} - B_{RP}$ . In case of a power-on with a magnetic field  $B$  within hysteresis ( $B_{OP} > B > B_{RP}$ ) the output of the sensor is set to the pull up voltage level ( $V_Q$ ) per default. After the first crossing of  $B_{OP}$  or  $B_{RP}$  of the magnetic field the internal decision logic is set to the corresponding magnetic input value.

$V_{DDA}$  is the internal supply voltage which is following the external supply voltage  $V_{DD}$ .

This means for  $B > B_{OP}$  the output is switching, for  $B < B_{RP}$  and  $B_{OP} > B > B_{RP}$  the output stays at  $V_Q$ .

**2.1 Application circuit**

The following **Figure 7** shows one option of an application circuit. As explained above the resistor  $R_S$  can be left out (see **Figure 8**). The resistor  $R_Q$  has to be in a dimension to match the applied  $V_S$  to keep  $I_Q$  limited to the operating range of maximum 25 mA.

e.g.:  $V_S = 12\text{ V}$ ;  $I_Q = 12\text{ V}/1200\ \Omega = 10\text{ mA}$

Supply voltage <sup>1)</sup>	$V_{DD}$	-18	–	32 42	V	– 10h, no external resistor required
Output voltage	$V_Q$	-0.5	–	32	V	–
Reverse output current	$I_Q$	-70	–	–	mA	–

Storage temperature	$T_S$	-40	–	150	°C	–
Thermal resistance Junction ambient	$R_{thJA}$	–	–	300 200	K/W	for PG-SOT23-3-15 (2s2p) for PG-SSO-3-2 (2s2p)

1) This lifetime statement is an anticipation based on an extrapolation of Infineon's qualification test results. The actual lifetime of a component depends on its form of application and type of use etc. and may deviate from such statement. The lifetime statement shall in no event extend the agreed warranty period.

**Attention:** *Stresses above the max. values listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Maximum ratings are absolute ratings; exceeding only one of these values may cause irreversible damage to the integrated circuit.*

Calculation of the dissipated power  $P_{DIS}$  and junction temperature  $T_J$  of the chip (SOT23 example):

e.g. for:  $V_{DD} = 12\text{ V}$ ,  $I_S = 2.5\text{ mA}$ ,  $V_{QSAT} = 0.5\text{ V}$ ,  $I_Q = 20\text{ mA}$

Power dissipation:  $P_{DIS} = 12\text{ V} \times 2.5\text{ mA} + 0.5\text{ V} \times 20\text{ mA} = 30\text{ mW} + 10\text{ mW} = 40\text{ mW}$

Temperature  $\Delta T = R_{thJA} \times P_{DIS} = 300\text{ K/W} \times 40\text{ mW} = 12\text{ K}$

For  $T_A = 50^\circ\text{C}$ :  $T_J = T_A + \Delta T = 50^\circ\text{C} + 12\text{ K} = 62^\circ\text{C}$

### 2.3 Operating range

The following operating conditions must not be exceeded in order to ensure correct operation of the TLI4961-1L/1M.

All parameters specified in the following sections refer to these operating conditions unless otherwise mentioned.

The maximum tested magnetic field is 600 mT.

**Table 6** Operating conditions parameters

Output current	$I_{\text{Q}}$	0	-	25	mA	-
Magnetic signal input frequency <sup>2)</sup>	$f_{\text{SW}}$	0	-	10	kHz	-

- 1) Latch-up test with factor 1.5 is not covered. Please see max ratings also.
- 2) For operation at the maximum switching frequency the magnetic input signal must be 1.4 times higher than for static fields. This is due to the -3 dB corner frequency of the internal low-pass filter in the signal path.
